MISE EN ROUTE

Direction vers les dossiers

Views-> pour créer les pages qui seront accessible au public.

Exemple:

Login.blade.php

Layout.blade.php

Userlist.blade.php

Create.blade.php

Welcome.blade.php (page par défaut)

Routes-> web.php: pour afficher les pages selon le type de routage définit par l'user.

Nb: toutes les pages que vous ajouterez dans views pourront être appelées dans la page web.php.

Exemple:

```
Route : : get('/', function(){
return view('login') ;
});
```

Vous pouvez gérer les divisions dans la page layout.blade.php, ci-dessous rien ne change dans les fondamentaux des feuilles de styles.

<body>

<div ---->

Section

</div>

</body>

Nb : noter qu'après vos divisions vous pouvez vous servir du bootstrap en ligne pour gérer toutes la mise en forme et style désiré.

```
welcome.blade.php
                                                                                                                                                                                                                                                              web.php

```

Exemple de la page userlist.blade.php

A ce niveau le bootstrap arrive avec sa facilité pour gérer les divisions, tels que header, content, footer. Finit le codage pur et dur comme en première année copier et coller à l'endroit désiré pour personnaliser selon votre guise.

Nb: si on veut fixer la page login par rapport aux autres on peut se servir de ce code puis faire la personnalisation sur les autres pages :

```
CPLORER
                     userlist.blade.php
                                             w web.php
                                                                                     m login.blade.php x
PEN EDITORS
                     resources > views > * login.blade.php
w userlist.blade.ph...
                            @extends('layout')
 web.php routes
